

Pair Programming Exercise

Format

The session is structured as follows:

- 10 min** Problem setup and review
- 60 min** Pair programming
- 5 min** Closing remarks and questions

We'll send you the dataset and problem statement roughly one hour before the interview begins, so you have time to orient yourself before we start the clock.

You'll work alongside one of our team members — think of them as a teammate you've just been paired with, not someone evaluating you from the sidelines. Ask questions, think out loud, change direction — that's all fair game and genuinely useful for us to see.

The problem space

The problem involves customer acquisition — specifically, understanding which channels tend to bring in customers who go on to generate real value. The emphasis is on your approach and reasoning rather than scale or production readiness.

There's no single correct answer and no expectation that you'll finish. We're much more interested in how you frame the problem, what questions you ask, and how you make decisions under ambiguity.

Tools

For your coding environment, use whichever of these works best for you:

Your local environment — whatever IDE you normally use, with a working Python environment that has pandas and numpy installed. You're welcome to install any additional packages over the course of the interview.

Google Colab — a pre-configured notebook is available at:

https://colab.research.google.com/drive/17AJvMTtRbi_rZ9i-2ee1p7T0KIq8B10r?usp=sharing

Beyond that, AI assistants, search, and any libraries you'd normally reach for are all fair game. The one thing we'll ask is that you stay able to explain and build on whatever ends up on the screen — your teammate will be curious about the choices you're making.

That's all you need going in. We're looking forward to it — see you then.
